

## ABSTRACT

A sexual aid device comprising a curved portion having a proximal and a distal end, a substantially straight portion, the straight portion extending from the proximal end of the curved portion thereby forming an approximate J shape, and mechanical means for causing movement of the curved portion is provided. The movement can be arcuate, circular, vibratory, an extending movement or a "come hither" movement. The distal end of the curved portion stimulates a female's Grafenberg spot or G spot when the device is inserted into the vagina with the straight portion pointing away from the curved portion towards the female's torso. The straight portion extends coextensively from the curved portion. The device also includes a clitoral stimulation portion which is textured and vibrates.
